

There is a part of you that observes even when you believe you are not observing.

As you read these lines, something within you is doing more than processing words. It evaluates, compares, anticipates, and decides whether this connects with what you already know.

Neuropsychology locates this capacity in the prefrontal cortex and calls it executive function and metacognition. The yogic tradition called it Ajna, the third eye. These are two names for the same remarkable capacity: the ability to observe yourself as you observe.

Having it does not guarantee using it, just as owning a grand piano does not make you a pianist. Lluís Carballo explains why we think so much and perceive so little, and what role intuition and somatic markers play in sound decision-making. He also shows how to train that inner observer through breathing, posture, mindfulness, and Atmandance conscious dance.

For psychologists, therapists, yoga teachers, and anyone who feels they think a great deal but perceive very little.

A book to awaken your inner detective.

ABOUT THE AUTHOR

Lluís Carballo is a clinical psychologist and psychotherapist with more than thirty years of experience in clinical practice, teaching, and bodywork. He was co-director of the Master's Program in Dance Therapy and Mindfulness at the University of Girona. He also created the Atmandance system, which brings together movement, emotion, voice, and awareness.
